Histoplasma Antigen Quantitative by EIA, Serum

Reference Interval:
Effective November 18, 2019
Not Detected

Interpretive Data: The quantitative range of this assay is 0.19-60.0 ng/mL. Antigen concentrations less than 0.19 ng/mL or greater than 60.0 ng/mL fall outside the linear range of the assay and cannot be accurately quantified.

This EIA test should be used in conjunction with other diagnostic procedures, including microbiological culture, histological examination of biopsy samples, serology and/or radiographic evidence, to aid in the diagnosis of histoplasmosis.

Cross-reactivity with Blastomyces dermatitidis, Coccidioides immitis, and possibly Talaromyces marneffei have been observed with this EIA. Other clinically and geographically relevant endemic mycoses should be considered in the case of a positive test result.

Test developed and characteristics determined by ARUP Laboratories. See Compliance Statement B: www.aruplab.com/CS
