DOB: [REDACTED] Age: [REDACTED] Gender: [REDACTED]
Patient Identifiers: [REDACTED]
Visit Number (FIN): [REDACTED]

Client: [REDACTED]
Physician: [REDACTED]

ARUP Test Code: 2002653
Collection Date: 11/21/2016
Received in lab: 11/23/2016
Completion Date: 11/27/2016

Interpretation

Specimen Received
Specimen Type: Bone Marrow
Reason for Referral: Pancytopenia; Possible MDS and AML
Test Performed: FISH, TAML MDS

ABNORMAL FISH RESULTS
7cen (D7Z1), 7q31 (D7S486): deletion present

NORMAL FISH RESULTS
5q31 (EGR1): deletion not detected
11q23 (KMT2A; also known as MLL): rearrangement / deletion not detected

DIAGNOSTIC IMPRESSION:
Fluorescence in situ hybridization (FISH) analysis was performed with the Therapy-Related AML/MDS Panel probes: EGR1, D7Z1, D7S486 and KMT2A (MLL) (Abbott Molecular). 200 interphase cells were scored for each probe combination.

This analysis showed evidence of deletion 7q31 involving the D7S486 locus in 27/200 (13.5 percent) cells scored.

The remaining probes showed normal results.

Deletion 7q is a recurrent abnormality observed in myeloid disorders, including MDS and AML. In the context of therapy-related myeloid neoplasms, this finding may indicate a poor prognosis.

Please correlate this result with clinical and other laboratory findings.
