

# Eosinophilia Panel by FISH

## Indications for Ordering

- Diagnose and classify specific eosinophilic myeloid neoplasms
  - AML with inv(16) or t(16;16)
  - Myeloid neoplasms with eosinophilia and abnormalities of *PDGFRA*, *PDGFRB*, or *FGFR1*
- Provide prognostic and predictive information for acute or chronic leukemia with eosinophilia
- Monitor therapeutic response

## Test Description

- Performed on cultured bone marrow (BM)
  - Peripheral blood may be used
- Multiple fluorescence in situ hybridization (FISH) probes target specific genes
  - *FGFR1* translocations
  - *FIP1L1-PDGFRB* region rearrangements
  - *PDGFRB* translocations
  - *CBFB/MYH11* translocation
- Probes can be run as a panel or individually

## Tests to Consider

### Primary test

#### [Eosinophilia Panel by FISH 2002378](#)

- Diagnosis, prognosis, and monitoring for newly diagnosed acute or chronic leukemia with eosinophilia

### Related tests

#### [Chromosome Analysis, Bone Marrow 2002292](#)

- Diagnosis, prognosis, and monitoring of eosinophilic leukemia

#### [Chromosome Analysis, Bone Marrow with Reflex to Genomic Microarray 2007130](#)

- Diagnosis, prognosis, and monitoring of eosinophilic disorders
- If chromosome analysis is “normal” or “no growth,” then genomic microarray testing will be added

#### [Cytogenomic SNP Microarray – Oncology 2006325](#)

- Preferred test for fresh specimens at time of diagnosis for detecting prognostically important genomic abnormalities in leukemias/lymphomas and solid tumors involving
  - Loss/gain of DNA
  - Loss of heterozygosity (LOH)
  - Monitor disease progression and response to therapy

#### [Chromosome FISH, Interphase 2002298](#)

- Specific FISH probes must be requested and include
  - *PDGFRA*
  - +8
  - Monosomy 7 or 7q deletion
  - 13q deletion
  - *PDGFRB*
  - +9
  - 5q deletion
  - 20q deletion

#### [Myeloproliferative Disorders Panel by FISH 2002360](#)

- Detect specific recurrent genomic aberrations in suspected MPNs
  - *BCR/ABL1*
  - *PDGFRA*
  - *PDGFRB*
  - *FGFR1*

#### [Myeloid Malignancies Mutation Panel by Next Generation Sequencing 2011117](#)

- Assess for single gene mutations, including substitutions and insertions and deletions that may have diagnostic, prognostic, and/or therapeutic significance

## Disease Overview

### Consensus criteria

- 2008 WHO classification of eosinophilic myeloid disorders
  - Myeloid and lymphoid neoplasms with *PDGFRA* rearrangement
  - Myeloid neoplasms with *PDGFRB* rearrangement
  - Myeloid and lymphoid neoplasms with *FGFR1* abnormalities
  - Chronic eosinophilic leukemia, not otherwise specified (CEL, NOS)
  - Idiopathic hypereosinophilic syndrome (HES)
  - Idiopathic hypereosinophilia

### Incidence/prevalence

- *PDGFRA/B*- and *FGFR1*-related disorders are not well characterized
- inv16; t(16;16)
  - 5-8% of AMLs
    - Predominantly in childhood

### Diagnostic criteria

See Table 1

### Genetics

See Table 2

### Test Interpretation

**Analytic sensitivity/specificity – >95%**

## Results

- Normal – no evidence of rearrangement
- Abnormal – rearrangement detected
  - Diagnostic of a clonal hematopoietic neoplasm
  - *inv(16); t(16;16)*
    - Prognosis – favorable in children and adults
      - Less favorable if *KIT* mutation is also present
    - Response to high dose cytarabine- and anthracycline-based chemotherapy – yes
      - Remission rate – 92%
      - 10-year survival – 55%
  - *PDGFRA* and *PDGFRB*
    - Prognosis – good

- Response to tyrosine kinase inhibitors (TKIs) such as imatinib – yes
- *FGFR1*-rearranged
  - Prognosis – poor
  - Response to TKIs such as imatinib – currently unclear
  - Response to chemotherapy protocols developed for acute leukemias – no

## Limitations

- Detects only rearrangements targeted by the probes
- *PDGFRB* gene on 5q33 and *FGFR1* gene on 8p11 have multiple translocation partners
- Translocation partners are not identified by this test

**Table 1**

WHO Classification	Features	Laboratory
AML with <i>inv(16)(p13.1q22)</i> or <i>t(16;16)(p13.1;q22); CBFβ-MYH11</i>	<ul style="list-style-type: none"> <li>• Presents as AML</li> <li>• Myeloid sarcomas may be present at initial diagnosis or relapse</li> </ul>	<ul style="list-style-type: none"> <li>• Morphology – acute myelomonocytic leukemia with increased eosinophils containing immature eosinophilic granules in the BM               <ul style="list-style-type: none"> <li>○ Peripheral eosinophilia is unusual</li> <li>○ Diagnosis of AML even if blasts &lt;20%</li> </ul> </li> <li>• Genetics               <ul style="list-style-type: none"> <li>○ <i>inv(16)(p13.1q22)</i> or <i>t(16;16)(p13.1;q22)</i> found in most cases                   <ul style="list-style-type: none"> <li>▪ <i>inv(16)(p13.1q22)</i> is found in vast majority</li> <li>▪ FISH or PCR may be necessary to document this genetic alteration</li> </ul> </li> <li>○ Secondary cytogenetic abnormalities – +22, +8, del(7q)</li> <li>○ <i>KIT</i> mutations may be present</li> </ul> </li> </ul>
Myeloid and lymphoid neoplasms with <i>PDGFRA</i> rearrangement	<ul style="list-style-type: none"> <li>• Most frequently presents as CEL, but may present as AML, T-lymphoblastic lymphoma, or both               <ul style="list-style-type: none"> <li>○ Acute transformation can follow CEL presentation</li> </ul> </li> <li>• Organ infiltration by eosinophils               <ul style="list-style-type: none"> <li>○ Heart</li> <li>○ Lungs</li> <li>○ CNS</li> <li>○ GI tract</li> </ul> </li> <li>• Splenomegaly in majority of patients</li> <li>• Pronounced male predominance</li> </ul>	<ul style="list-style-type: none"> <li>• Morphology               <ul style="list-style-type: none"> <li>○ Peripheral blood and BM eosinophilia (markedly elevated)</li> <li>○ Typically &lt;20% blasts in peripheral blood and BM</li> <li>○ Increased BM mast cells common</li> </ul> </li> <li>• Genetics               <ul style="list-style-type: none"> <li>○ Absence of BCR-ABL1 fusion gene</li> <li>○ Most commonly associated with <i>FIP1L1-PDGFRα</i> fusion                   <ul style="list-style-type: none"> <li>▪ FISH or PCR is usually necessary to document this genetic alteration; cytogenetic studies are normal</li> </ul> </li> <li>○ Other fusion genes have rarely been identified</li> </ul> </li> </ul>
Myeloid and lymphoid neoplasms with <i>PDGFRB</i> rearrangement	<ul style="list-style-type: none"> <li>• Presents with features of chronic myelomonocytic leukemia (usually with eosinophilia)</li> <li>• Splenomegaly in majority of patients</li> <li>• Male predominance, but much less marked than <i>PDGFRA</i>-associated neoplasms</li> </ul>	<ul style="list-style-type: none"> <li>• Morphology               <ul style="list-style-type: none"> <li>○ Peripheral leukocytosis</li> <li>○ Hypercellular BM with typically &lt;20% blasts</li> <li>○ Increased BM mast cells common</li> </ul> </li> <li>• Genetics               <ul style="list-style-type: none"> <li>○ Most common translocation-<i>t(5;12)(q31-33;p13)</i> resulting in formation of <i>ETV6-PDGFRB</i></li> </ul> </li> </ul>
Myeloid and lymphoid neoplasms with <i>FGFR1</i> abnormalities	<ul style="list-style-type: none"> <li>• Often presents with peripheral eosinophilia in the context of lymphadenopathy and lymphoblastic leukemia/lymphoma</li> <li>• Slight male predominance</li> </ul>	<ul style="list-style-type: none"> <li>• Morphology               <ul style="list-style-type: none"> <li>○ AML, ALL, CEL (usually associated with peripheral blood or BM eosinophilia)</li> </ul> </li> <li>• Genetics               <ul style="list-style-type: none"> <li>○ Presence of <i>t(8;13)(p11;q12)</i> or a variant translocation at the 8p11 breakpoint leading to <i>FGFR1</i> rearrangement</li> <li>○ Secondary cytogenetic abnormalities – trisomy 21 most often observed</li> </ul> </li> </ul>
