**IGH-MYC Fusion t(8;14) by FISH**

**Indications for Ordering**

Diagnosis of Burkitt lymphoma (BL) or diffuse large B-cell lymphoma (DLBCL) with features intermediate between BL and DLBCL in conjunction with clinical, morphologic, and flow cytometric data

**Test Description**

**IGH-MYC Fusion t(8;14) by FISH**
- Fluorescence in situ hybridization (FISH)
- Tricolor, dual fusion probes detect t(8;14) or IGH-MYC gene rearrangement

**MYC (8q24) Gene Rearrangement by FISH**
- FISH

**Tests to Consider**

**Typical Testing Strategy**

**BL**
- Lymph node biopsy with morphological and immunohistochemical evaluation
- Leukemia/Lymphoma Phenotyping by Flow Cytometry
  - CD5-, CD10+, CD 19/20+ suggests BL
  - CD5-, CD10+, bcl6, bcl2, high Ki67 proliferation index suggests features intermediate between BL and DLBCL
- Detect cytogenetic abnormalities, if necessary
  - IGH-MYC t(8;14) by FISH
  - MYC (8q24) Gene Rearrangement by FISH
  - Bone marrow and CSF evaluation

**B-cell lymphoma with features intermediate between BL and DLBCL**
- Above strategy plus
  - IGH-BCL2 Fusion, t(14;18) by FISH
  - Lymphoma (Aggressive) Panel by FISH

**Primary Tests**

**IGH-MYC Fusion t(8;14) by FISH 3001299**
- Facilitates diagnosis of BL and B-cell lymphoma with features intermediate between BL and DLBCL
- Formalin-fixed, paraffin-embedded (FFPE) tissue

**MYC (8q24) Gene Rearrangement by FISH 3001300**
- Facilitates diagnosis of BL and B-cell lymphoma with features intermediate between BL and DLBCL
- Detects all MYC rearrangements including t(8;14), t(2;8), and t(8;22) rearrangements
  - Does not identify translocation partner
  - FFPE tissue

**Related Tests**

**Leukemia/Lymphoma Phenotyping by Flow Cytometry 2008003**
- Aids in diagnosis of hematopoietic neoplasms

**IGH-BCL2 Fusion, t(14;18) by FISH 3001298**
- Most sensitive method to detect IGH-BCL2 fusion in FFPE tissue

**Chromosome FISH, Interphase 2002298**
- Specific FISH probe t(8;14) must be requested
- Fresh tissue specimens only

**Chromosome Analysis, Bone Marrow 2002292**
- Diagnosis, prognosis, and monitoring of hematopoietic neoplasms
- Fresh tissue specimens only

**Chromosome Analysis, Solid Tumor 2002296**
- May identify additional, useful cytogenetic abnormalities in tissues that are not targeted by FISH assays

**Lymphoma (Aggressive) Panel by FISH 2002650**
- Aid in diagnosis/prognostication for aggressive morphology and unclear features between BL and DLBCL
- Probes detect MYC, BCL2, IGH, BCL6
- Fresh tissue specimens only
Disease Overview

Diagnostic Issues
- BL is often diagnosed using the combination of morphology, immunohistochemistry, immunophenotyping, and clinical presentation
  - Cytogenetic testing may be necessary if morphology has aggressive features and the BL categorization cannot be made
  - IGH-MYC t(8;14) and MYC t(8q24) gene rearrangement by FISH may be useful when the above combination does not yield a diagnosis
- B-cell lymphomas with features intermediate between BL and DLBCL
  - These lymphomas have recurrent chromosomal breakpoint aberrations
    - B-cell lymphomas with two recurrent chromosomal breakpoint aberrations are referred to as high-grade B-cell lymphomas with MYC and BCL2 and/or BCL6 (WHO, 2016)
      - Usually involve MYC oncogene in association with BCL2, less often with BCL6
    - Lymphomas with three translocations (usually MYC/BCL2/BCL6) are referred to as triple-hit lymphomas
      - Rare
  - Important to identify these lymphomas in diagnostic evaluation of morphologically aggressive lymphomas
    - Highly resistant to standard chemotherapy
    - Poor outcome independent of regimen intensity or inclusion of rituximab
  - Individuals have shortened survival compared with those having BL or international prognostic index (IPI)-matched DLBCL

Genetics

Gene – MYC

Translocations
- IGH-MYC t(8;14), IGK-MYC t(2;8), IGL-MYC t(8;22)
  - Translocations involving MYC are characteristic but not specific for BL
  - IGH-MYC t(8;14) most common translocation
  - Other nonimmunoglobulin transcription partners have been identified

Test Interpretation

IGH-MYC t(8;14) by FISH

Results
- Positive – presence of the IGH-MYC t(8;14) translocation supports a diagnosis of BL or B-cell lymphomas with features intermediate between BL and DLBCL, depending on clinical presentation, morphology, and immunophenotyping
- Negative – absence of the IGH-MYC t(8;14) translocation

Limitations
- Negative result does not rule out BL or B-cell lymphomas with features intermediate between BL and DLBCL involving MYC with other translocation partners, such as t(2;8) or t(8;22)
- IGH-MYC t(8;14) by FISH has not been validated for tissue fixed in alcohol-based or non-formalin fixatives
- MYC is not specific for BL or B-cell lymphomas with features intermediate between BL and DLBCL

MYC (8q24) Gene Rearrangement by FISH

Results
- Positive – presence of the IGH-MYC translocation supports a diagnosis of BL or B-cell lymphomas with features intermediate between BL and DLBCL
- Negative – absence of any MYC rearrangements

Limitations
- Negative result does not rule out BL or B-cell lymphomas with features intermediate between BL and DLBCL
- MYC (8q24) gene rearrangement by FISH has not been validated for tissue fixed in alcohol-based or non-formalin fixatives
- MYC is not specific for BL or B-cell lymphomas with features intermediate between BL and DLBCL
