

# Myeloproliferative Neoplasms Panel by FISH

## Indications for Ordering

- Aids in diagnosis and classification of specific myeloproliferative neoplasms (MPNs) with eosinophilia in conjunction with cytogenetic testing
  - Chronic myelogenous leukemia (CML) – *BCR-ABL1* positive
  - Myeloid and lymphoid neoplasms with eosinophilia and abnormalities of *PDGFRA*, *PDGFRB*, or *FGFR1*
- Monitor minimal residual disease (MRD) in MPNs

## Test Description

- Performed on bone marrow (BM)
  - Peripheral blood may be used but not preferred
- Probes target
  - *BCR-ABL1* fusion
  - *FGFR1* translocations
  - *FIP1L1-PDGFRB* region rearrangements
  - *PDGFRB* translocations
- Each probe can be run as a panel or individually

## Tests to Consider

### Primary test

#### [Myeloproliferative Disorders Panel by FISH 2002360](#)

- Limited role in the workup of myeloproliferative neoplasms in the setting of an otherwise optimal cytogenetic study
- Aids in exclusion of cryptic *BCR-ABL1* rearrangement in CML and in the exclusion of a *PDGFRA* abnormality in cases of neoplastic eosinophilia

### Related tests

#### [Chromosome Analysis, Bone Marrow 2002292](#)

- Diagnosis, prognosis, and monitoring of MPNs
- Does not detect insertion in *BCR-ABL* fusion gene

#### [Chromosome Analysis, Bone Marrow with Reflex to Genomic Microarray 2007130](#)

- Diagnosis, prognosis, and monitoring of MPNs
- If chromosome analysis is “normal” or “no growth,” then genomic microarray testing will be added

#### [Eosinophilia Panel by FISH 2002378](#)

- Diagnosis, prognosis, and monitoring of eosinophilic leukemias
- Probes target
  - *FGFR1* translocations
  - *FIP1L1-PDGFRB* region rearrangements
  - *PDGFRB* translocations
  - *CBFB/MYH11* translocation

#### [Chromosome FISH, Interphase 2002298](#)

- Specific FISH probes must be requested and include
  - *PDGFRA*
  - *PDGFRB*
  - *FGFR1*
  - *BCR-ABL1*
  - *inv(16)*

#### [Myeloid Malignancies Mutation Panel by Next Generation Sequencing 2011117](#)

- Assess for single gene mutations, including substitutions and insertions and deletions that may have diagnostic, prognostic, and/or therapeutic significance

## Disease Overview

### Diagnostic issues

- FISH analysis has several advantages over chromosome studies in MPN diagnosis
  - More rapid turnaround time
  - Can be performed on interphase cells
  - Can detect subtle or cryptic rearrangements
- For clinical features of specific MPNs, see Table 1

### Genetics

See Table 2

### Test Interpretation

Analytic sensitivity/specificity – >95%

### Results

- Normal – analysis using panel probes *BCR-ABL1*, *PDGFRA*, *PDGFRB*, and *FGFR1* shows no evidence of rearrangement

- Abnormal – rearrangement detected
  - Diagnostic of a clonal hematopoietic neoplasm
  - *BCR-ABL1*
    - Prognosis – good
    - Response to tyrosine kinase inhibitors (TKIs) such as imatinib – yes
  - *PDGFRA* and *PDGFRB* positive neoplasms
    - Prognosis – good
    - Response to TKIs such as imatinib – yes
  - *FGFR1*-rearranged myeloid/lymphoid neoplasms
    - Prognosis – poor
    - Response to TKIs such as imatinib – currently unclear
    - Response to chemotherapy protocols developed for acute leukemias – no

#### Limitations

- Only detects rearrangements targeted by the probes
- The translocation partners of the *PDGFRB* gene on 5q33 and *FGFR1* gene on 8p11 have multiple translocation partners
  - These translocation partners are not identified by this test

**Table 1. MPN Subtypes, Features, and Diagnostic Criteria**

WHO Classification	Features	Laboratory
Chronic myelogenous leukemia, <i>BCR-ABL1</i> positive	<ul style="list-style-type: none"> <li>• Many are asymptomatic, but diagnosed when abnormal CBC is reported</li> <li>• Symptomatic individuals present with fatigue, night sweats, weight loss, and splenomegaly</li> </ul>	<ul style="list-style-type: none"> <li>• Morphology – peripheral leukocytosis               <ul style="list-style-type: none"> <li>○ Anemia common</li> </ul> </li> <li>• Genetics – majority of individuals have <i>BCR-ABL1</i> translocation</li> </ul>
Myeloid and lymphoid neoplasms with <i>PDGFRA</i> rearrangement	<ul style="list-style-type: none"> <li>• Most frequently presents as chronic eosinophilic leukemia (CEL), but may present as acute myeloid leukemia (AML), T-cell lymphoblastic lymphoma (T-LBL), or both               <ul style="list-style-type: none"> <li>○ Acute transformation can follow CEL presentation</li> </ul> </li> <li>• Organ infiltration by eosinophils               <ul style="list-style-type: none"> <li>○ Heart</li> <li>○ Lungs</li> <li>○ CNS</li> <li>○ GI tract</li> </ul> </li> <li>• Splenomegaly in majority of individuals</li> <li>• Pronounced male predominance</li> </ul>	<ul style="list-style-type: none"> <li>• Morphology               <ul style="list-style-type: none"> <li>○ Peripheral blood and BM eosinophilia – markedly elevated</li> <li>○ Typically &lt;20% blasts in peripheral blood and BM</li> <li>○ Increased BM mast cells common</li> </ul> </li> <li>• Genetics               <ul style="list-style-type: none"> <li>○ Absence of <i>BCR-ABL1</i> fusion gene</li> <li>○ Most commonly associated with <i>FIP1L1-PDGFRB</i> fusion                   <ul style="list-style-type: none"> <li>▪ FISH or PCR is usually necessary to document this genetic alteration; cytogenetic studies are normal</li> </ul> </li> <li>○ Other fusion genes have rarely been identified</li> </ul> </li> </ul>
Myeloid and lymphoid neoplasms with <i>PDGFRB</i> rearrangement	<ul style="list-style-type: none"> <li>• Presents with features of CML (usually with eosinophilia)</li> <li>• Splenomegaly in majority of individuals</li> <li>• Male predominance, but much less marked than <i>PDGFRA</i>-associated neoplasms</li> </ul>	<ul style="list-style-type: none"> <li>• Morphology               <ul style="list-style-type: none"> <li>○ Peripheral leukocytosis</li> <li>○ Hypercellular BM with typically &lt;20% blasts</li> <li>○ Increased BM mast cells common</li> </ul> </li> <li>• Genetics               <ul style="list-style-type: none"> <li>○ Most common translocation – t(5;12)(q31-33;p13) resulting in formation of <i>ETV6-PDGFRB</i></li> </ul> </li> </ul>
Myeloid and lymphoid neoplasms with <i>FGFR1</i> abnormalities	<ul style="list-style-type: none"> <li>• Often presents with peripheral eosinophilia in the context of lymphadenopathy and lymphoblastic leukemia/lymphoma</li> <li>• Slight male predominance</li> </ul>	<ul style="list-style-type: none"> <li>• Morphology               <ul style="list-style-type: none"> <li>○ AML, ALL, CEL (usually associated with peripheral blood or BM eosinophilia)</li> </ul> </li> <li>• Genetics               <ul style="list-style-type: none"> <li>○ Presence of t(8;13)(p11;q12) or a variant translocation at the 8p11 breakpoint leading to <i>FGFR1</i> rearrangement</li> <li>○ Secondary cytogenetic abnormalities – trisomy 21 most often observed</li> </ul> </li> </ul>

**Table 2. Overview of Genes and Mutations for Eosinophilic Disorders Tested for by this Panel**

Gene	Structure/Function	Mutations	WHO Disease Association
<i>BCR-ABL1</i>	<ul style="list-style-type: none"> <li>• Maps to 9q24</li> <li>• Chimeric constitutively active tyrosine kinase</li> </ul>	<ul style="list-style-type: none"> <li>• Majority of cases are translocation t(9;22) (q34q11.2)               <ul style="list-style-type: none"> <li>○ Results in Philadelphia chromosome</li> </ul> </li> <li>• Remaining cases have variant translocations that involve a 3<sup>rd</sup> or 4<sup>th</sup> chromosome or cryptic translocation</li> </ul>	CML, <i>BCR-ABL1</i> positive
<i>PDGFRA</i>	<ul style="list-style-type: none"> <li>• Maps to 4q12</li> <li>• Cell surface tyrosine kinase receptor for members of the platelet-derived growth factor family</li> <li>• Results in a constitutively active tyrosine kinase oncoprotein</li> </ul>	<ul style="list-style-type: none"> <li>• <i>FIP1L1-PDGFRB</i> rearrangement is a karyotypically occult 800-kb interstitial deletion (ie, <i>CHIC2</i> deletion)</li> </ul>	Myeloid and lymphoid neoplasms with <i>PDGFRA</i> rearrangement

<b>Gene</b>	<b>Structure/Function</b>	<b>Mutations</b>	<b>WHO Disease Association</b>
<i>PDGFRB</i>	<ul style="list-style-type: none"> <li>• Maps to 5q31-33</li> <li>• Cell surface tyrosine kinase receptor for members of the platelet-derived growth factor family</li> <li>• Results in a constitutively active tyrosine kinase oncoprotein</li> </ul>	<ul style="list-style-type: none"> <li>• 20 fusion partners reported</li> <li>• Most common translocation – t(5;12)(q31-33;p13); <i>ETV6-PDGFRB</i></li> </ul>	Myeloid and lymphoid neoplasms with <i>PDGFRB</i> rearrangement
<i>FGFR1</i>	<ul style="list-style-type: none"> <li>• Maps to 8p11</li> <li>• Cell surface tyrosine kinase</li> <li>• Translocations result in constitutive activation of <i>FGFR1</i> with the fusion of the <i>FGFR1</i> C-terminal catalytic domain with unrelated proteins</li> </ul>	<ul style="list-style-type: none"> <li>• &gt;10 fusion partners identified</li> <li>• Most common translocation – t(8;13)(p11;q12); ZNF198-<i>FGFR1</i> mutation</li> </ul>	Myeloid and lymphoid neoplasms with <i>FGFR1</i> abnormalities
