Antibody Identification

Anti-Le(a) (LE1) was previously identified in this patient's serum and remains reactive. No additional red cell antibodies were apparent at this time.

Anti-Le(a) has not been shown to cause hemolytic disease of the fetus and newborn (HDFN) since the corresponding Le(a) (LE1) antigen is not fully developed at birth. Anti-Le(a) has been implicated as a cause of transfusion reactions.

If red cell transfusion is required for mother or infant, donor units can be selected by compatible antiglobulin crossmatch.
