APC Resistance Profile

ARUP test code 0030127

APC Resistance Panel

1.43 L (Ref Interval: >=2.00)

The American College of Medical Genetics recommends that patients who test positive by a functional assay for Factor V Leiden should be further studied with the DNA test for confirmation and to distinguish heterozygotes from homozygotes.

TEST INTERPRETATION: APC Resistance Profile

Ratios less than 2.00 suggest APC resistance. This method uses factor V deficient plasma; therefore, APC resistance due to a nonfactor V mutation will not be detected. Extreme factor V deficiency or presence of direct oral anticoagulants (DOACs) may cause an unreliable ratio.
