Lupus Anticoagulant Interpretation

See Note

Lupus anticoagulant detected.

International Society on Thrombosis and Haemostasis criteria for lupus anticoagulant identification include prolongation of one or more phospholipid-dependent clotting tests (screening), inhibitory activity in a 1:1 mix, and phospholipid-dependence in a confirmation test (shortened clotting time in the presence of excess phospholipid).

Testing on two or more occasions at least 12 weeks apart is recommended to confirm persistently positive results (J Thromb Haemost 2006;4:295-306). Lupus anticoagulant testing is best performed when the patient is stable and not anticoagulated since high concentrations of heparin, warfarin, or other anticoagulant medications may lead to false-positive results.
