INTERPRETIVE INFORMATION: p53 with Interpretation
by Immunohistochemistry

Abnormalities of the p53 gene are one of the most common genetic changes associated with cancer and can be found in a wide variety of tumor types. p53 protein expression is generally associated with a worse prognosis. According to some studies, nuclei staining in less than 10 percent of specimen cells is defined as negative for p53, and nuclei staining in greater than or equal to 10 percent of specimen cells is considered positive for p53. Results of this test should be interpreted with caution and within the context of other clinical data.
