**C-Reactive Protein, High Sensitivity**

ARUP test code 0050182

CRP, High Sensitivity

0.6 mg/L (Ref Interval: <=3.0)

INTERPRETIVE INFORMATION: CRP, High Sensitivity

Patients with higher hs-CRP concentrations are more likely to develop stroke, myocardial infarction, and severe peripheral vascular disease.

CRP is a nonspecific marker of inflammation and a variety of conditions other than atherosclerosis may cause elevated concentrations. If the first result is greater than 3.0 mg/L, recommend repeating test at least 2 weeks later in a metabolically stable state, free of infection or acute illness. The lower of the two results should be used to determine the patient's risk.

Significantly decreased CRP values may result in specimens from patients treated with carboxypenicillins.

hs-CRP results are used to assign risk as follows (Clin Chem 2009;55:378-84):

- less than 1.0 mg/L .... low risk
- 1.0 - 3.0 mg/L ..... average risk
- 3.1 - 9.9 mg/L ..... high risk
- greater than 9.9 mg/L . very high risk
