**Patient: Patient, Example**

**DOB:** 12/19/1961  
**Gender:** Male  
**Patient Identifiers:** 01234567890ABCD, 012345  
**Visit Number (FIN):** 01234567890ABCD  
**Collection Date:** 00/00/0000 00:00

**West Nile Virus Antibody, IgG by ELISA, Serum**

ARUP test code 0050234

West Nile Virus Ab, IgG, Ser

**3.10 IV H (Ref Interval: <=1.29)**

INTERPRETIVE INFORMATION: West Nile Virus Ab, IgG by ELISA, Serum

- 1.29 IV or less ..... Negative - No significant level of West Nile virus IgG antibody detected.
- 1.30 - 1.49 IV ..... Equivocal - Questionable presence of West Nile virus IgG antibody detected. Repeat testing in 10-14 days may be helpful.
- 1.50 IV or greater ..... Positive - Presence of IgG antibody to West Nile virus detected, suggestive of current or past infection.

This test is intended to be used as a semi-quantitative means of detecting West Nile virus-specific IgG in serum samples in which there is a clinical suspicion of West Nile virus infection. This test should not be used solely for quantitative purposes, nor should the results be used without correlation to clinical history or other data. Because other members of the Flaviviridae family, such as St. Louis encephalitis virus, show extensive cross-reactivity with West Nile virus, serologic testing specific for these species should be considered.

Seroconversion between acute and convalescent sera is considered strong evidence of current or recent infection. The best evidence for infection is a significant change on two appropriately timed specimens, where both tests are done in the same laboratory at the same time.

**H=High, L=Low, \*=Abnormal, C=Critical**
