Herpes Simplex Virus Type 1 and/or 2 Antibodies, IgG and IgM with Reflex to Type 1 and 2 Glycoprotein G-Specific Ab, IgG
ARUP test code 0050916

HSV Type 1/2 Combined Ab, IgG
1.50 IV

Specimen tested positive for Herpes Simplex Virus Type 1 and/or 2 Antibodies, IgG. ARUP test codes 0050292 and 0050294 will be added. Additional charges apply.

INTERPRETIVE INFORMATION: HSV 1/2 COMBINED Ab SCREEN, IgG
0.89 IV or Less ...............Not Detected
0.90-1.09 IV..............Indeterminate- Repeat testing in 10-14 days may be helpful.
1.10 IV or Greater.......Detected

The best evidence for current infection is a significant change on two appropriately timed specimens, where both tests are done in the same laboratory at the same time.

HSV 1 and/or 2 Abs, IgM by ELISA
2.60 IV H
(Ref Interval: <=0.89)

INTERPRETIVE INFORMATION: Herpes Simplex Virus Type 1 and/or 2 Antibodies, IgM by ELISA

0.89 IV or Less ...............Not Detected
0.90 - 1.09 IV ..............Indeterminate- Repeat testing in 10-14 days may be helpful.
1.10 IV or Greater.......Detected-IgM antibody to HSV detected, which may indicate a current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.

Herpes Simplex Virus Type 1 Glycoprotein G-Specific Antibody, IgG by CIA
ARUP test code 0050292

HSV 1 Glycoprotein G Ab, IgG
2.20 IV H
(Ref Interval: <=0.90)

H - high  L - low  * - abnormal  C - critical
INTERPRETIVE INFORMATION: HSV 1 Glycoprotein G Ab, IgG (CIA)

- 0.90 IV or less ........ Negative - No significant level of detectable IgG antibody to HSV type 1 glycoprotein G.
- 0.91 - 1.09 IV ........ Equivocal - Questionable presence of IgG antibody to HSV type 1 glycoprotein G. Repeat testing in 10-14 days may be helpful.
- 1.10 IV or greater ..... Positive - IgG antibody to HSV type 1 glycoprotein G detected, which may indicate a current or past HSV infection.

Individuals infected with HSV may not exhibit detectable IgG antibody to type specific HSV antigens 1 and 2 in the early stages of infection. Detection of antibody presence in these cases may only be possible using a non-type specific screening test.

**Herpes Simplex Virus Type 2 Glycoprotein G-Specific Antibody, IgG by CIA**

**HSV 2 Glycoprotein G Antibody, IgG**

2.20 IV H (Ref Interval: <=0.90)

**INTERPRETIVE INFORMATION: HSV 2 Glycoprotein G Ab, IgG (CIA)**

- 0.90 IV or less ........ Negative - No significant level of detectable IgG antibody to HSV type 2 glycoprotein G.
- 0.91 - 1.09 IV ........ Equivocal - Questionable presence of IgG antibody to HSV type 2 glycoprotein G. Repeat testing in 10-14 days may be helpful.
- 1.10 IV or greater .... Positive - IgG antibody to HSV type 2 glycoprotein G detected, which may indicate a current or past HSV infection.

Individuals infected with HSV may not exhibit detectable IgG antibody to type specific HSV antigens 1 and 2 in the early stages of infection. Detection of antibody presence in these cases may only be possible using a non-type specific screening test.
