INTERPRETIVE INFORMATION: Vanillylmandelic Acid (VMA), Urine

Vanillylmandelic acid (VMA) results are expressed as a ratio to creatinine excretion (mg/g CRT). VMA mass per day (mg/d) is not reported on specimens from patients younger than 18 years of age, or for random specimens, urine collection periods other than 24 hours, or urine volumes less than 400 mL/d. No reference interval is available for results reported in units of mg/L. Slight or moderate increases in catecholamine metabolites may be due to extreme anxiety, essential hypertension, intense physical exercise, or drug interactions. Significant increase of one or more catecholamine metabolites (several times the upper reference limit) is associated with an increased probability of a secreting neuroendocrine tumor.
