Catecholamines Fractionated (Epinephrine, Norepinephrine), Plasma

ARUP test code 0080957

Epinephrine	56 pg/mL		(Ref Interval: 10-200)
Norepinephrine	1264 pg/mL	H	(Ref Interval: 80-520)

Catecholamine Interpretation

See Note

INTERPRETIVE INFORMATION: Catecholamine Epi/Nor, Plasma

Small increases in catecholamines (less than 2 times the upper reference limit) usually are the result of physiological stimuli, drugs, or improper specimen collection. Significant elevation of one or more catecholamines (2 or more times the upper reference limit) is associated with an increased probability of a neuroendocrine tumor. Measurement of plasma or urine fractionated metanephrines provides better diagnostic sensitivity than measurement of catecholamines.

Higher catecholamine concentrations are observed in specimens collected from upright or standing adults. Epinephrine may be increased by approximately 20 percent; and norepinephrine increased up to 700 pg/mL.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.
