Opiates, Urine, Quantitative

6-acetylmorphine, Urn, Quant	<10 ng/mL				
	INTERPRETIVE INFORMATION: Opiates, Urine, Quantitative				
	Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry Positive cutoff: 20 ng/m∟ except as specified below 6-acetylmorphine 10 ng/m∟ For medical purposes only; not valid for forensic use.				
	Identification of specific drug(s) taken by specimen donor is problematic due to common metabolites, some of which are prescription drugs themselves. The absence of expected drug(s) and/or drug metabolite(s) may indicate non-compliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. All drug analytes covered are in the non-glucuronidated (free) forms. The concentration value must be greater than or equal to the cutoff to be reported as positive. A very small amount of an unexpected drug analyte in the presence of a large amount of an expected drug analyte may reflect pharmaceutical impurity. Interpretive questions should be directed to the laboratory. This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was				
	performed in a CLIA certified laboratory and is intended for clinical purposes.
