Titanium Quantitative, Serum or Plasma

ARUP test code 0091434

Titanium Quantitative, Serum or Plasma

None Det mcg/L

Serum
Reporting Limit: 10 mcg/L
The normal value for titanium is generally less than 5 mcg/L. In patients with a titanium-based implant/prosthesis, a serum concentration greater than 10 mcg/L may be indicative of wear. However, a reported titanium value alone is not predictive of prosthesis wear or failure.
Analysis by Inductively Coupled Plasma/Mass Spectrometry (ICP/MS)
Disclaimer: Specimens for elemental testing should be collected in certified metal-free containers. Elevated results for elemental testing may be caused by environmental contamination at the time of specimen collection and should be interpreted accordingly. It is recommended that unexpected elevated results be verified by testing another specimen.
Testing performed at NMS Labs, Inc.
