## PML-RARA Detection by RT-PCR, Quantitative

ARUP test code 2002871

**PML-RARA Translocation Source** 

Whole Blood

**PML-RARA Translocation** 

Not Detected

PML-RARA fusion transcripts were not detected by RT-PCR. This result does not entirely exclude the possibility of t(15;17) positive cells in the sample below the test limit of detection.

This result has been reviewed and approved by

BACKGROUND INFORMATION: PML-RARA Translocation

This test is designed to detect t(15;17) PML-RARA, a recurrent genetic abnormality found in a subset of patients with acute myeloid leukemia. This test detects all three gene fusion patterns: type A (short, S-form, bcr-3), type B (long, L-form, bcr-1), and type B variant (variable, V-form, bcr-2).

Methodology:

Patient RNA is isolated, reverse transcribed into cDNA, and amplified using primers specific for the PML and RARA genes. Real time PCR is then performed to detect t(15;17). PML-RARA and ABL (control) transcripts are quantified. Results are reported as a normalized ratio of PML-RARA transcripts to ABL transcripts present in the sample.

Limitations:

Translocations involving other genes or gene partners will not be detected.

Limit of detection for this test is 1 in 10,000 cells.

Results of this test must always be interpreted within the patient's clinical context and in conjunction with other relevant data, and should not be used alone for a diagnosis of malignancy.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.
