Japanese Encephalitis Virus Antibody, IgM by ELISA

ARUP test code 2005685

Japanese Encephalitis Virus Antibody IgM

2.0 IV (Ref Interval: <=6.0)

INTERPRETIVE INFORMATION: Japanese Encephalitis Virus Antibody, IgM by ELISA

- 3.9 IV or less Negative - No significant level of detectable Japanese encephalitis virus (JEV) IgM antibody.
- 4.0 - 6.0 IV Equivocal - Questionable presence of JEV IgM antibody. Repeat testing in 10-14 days may be helpful.
- 6.1 IV or greater Positive - JEV IgM antibody detected, which may indicate a current or recent infection. A low IgM antibody level may occasionally persist for more than 12 months post-infection.

A positive result (6.1 IV or greater) indicates the presence of IgM antibody to a flavivirus in the Japanese encephalitis serogroup or the dengue virus serogroup. The best evidence of current infection is a significant change on two appropriately timed specimens with both tests performed in the same laboratory at the same time.

Test developed and characteristics determined by ARUP Laboratories. See Compliance Statement D: aruplab.com/CS
