BRAF V600E Mutation Detection in Hairy Cell Leukemia by Real-Time PCR, Quantitative
ARUP test code 2007132

BRAF V600E Detection Hairy Cell, Result

Not Detected

A BRAF V600E mutation was not detected. This does not exclude the possibility of other codon 600 mutations or mutations at other positions in the BRAF gene. It also does not exclude the possibility of V600E mutations below the assay limit of detection.

This result has been reviewed and approved by.

Test information: BRAF V600E Detection Hairy Cell

This test is designed to detect the point mutation c.1799T>A in the BRAF gene. This point mutation changes the amino acid sequence resulting in p.Val600Glu (V600E). BRAF V600E mutations are present in the majority of cases of classic hairy cell leukemia.

Methodology:
Genomic DNA is isolated from the specimen. The BRAF V600E mutant allele is quantitated by allele-specific real-time PCR. Results are expressed as percent BRAF V600E mutant allele.

Limitations:
Mutations in other locations within the BRAF gene or mutations in other genes will not be detected. The limit of detection for this test is 0.2 percent mutant alleles, which corresponds to 0.4 percent heterozygous mutant cells.

Results of this test must always be interpreted within the clinical context and other relevant data, and should not be used alone for a diagnosis of malignancy.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.
