Echinococcus Antibody, IgG

ARUP test code 2007220

Echinococcus Antibody IgG

0.3 IV (Ref Interval: 0.0-0.8)

INTERPRETIVE INFORMATION: Echinococcus Antibody IgG

- 0.0-0.8 IV.....Negative - No significant level of Echinococcus IgG antibody detected.
- 0.9-1.1 IV.....Equivocal - Questionable presence of Echinococcus IgG antibody detected. Repeat testing in 10-14 days may be helpful.
- 1.2 IV or greater.....Positive - Presence of IgG antibody to Echinococcus detected, suggestive of current or past infection.

Patients with collagen vascular diseases, hepatic cirrhosis, schistosomiasis, and other parasitic infections can produce false-positive results. There is a strong cross-reaction between echinococcosis and cysticercosis positive sera.

Seroconversion between acute and convalescent sera is considered strong evidence of recent infection. The best evidence for infection is a significant change on two appropriately timed specimens where both tests are done in the same laboratory at the same time.
