Physician: Doctor, Example

Patient: Patient, Example

DOB: 5/2/1954
Gender: Male
Patient Identifiers: 01234567890ABCD, 012345
Visit Number (FIN): 01234567890ABCD
Collection Date: 00/00/0000 00:00

Echinococcus Antibody, IgG

ARUP test code 2007220

Echinococcus Antibody IgG

2 U (Ref Interval: 0-8)

INTERPRETIVE INFORMATION: Echinococcus Antibody IgG

0 - 8 U.....Negative - No significant level of Echinococcus IgG antibody detected.

9 - 11 U.....Equivocal - Recommend repeat testing in 2-4 weeks with fresh sample.

12 U or greater.....Positive - IgG antibodies to Echinococcus detected, indicating current or past infection.

Patients with collagen vascular diseases, hepatic cirrhosis, schistosomiasis, and other parasitic infections can produce false-positive results. There is a strong cross-reaction between echinococcosis and cysticercosis positive sera.

Seroconversion between acute and convalescent sera is considered strong evidence of recent infection. The best evidence for infection is a significant change on two appropriately timed specimens where both tests are done in the same laboratory at the same time.
