INTERPRETIVE INFORMATION: ALK(D5F3) by IHC Result

A result of negative is defined by absence of cytoplasmic staining in tumor cells. A positive result is defined as the presence of strong and diffuse, cytoplasmic staining in tumor cells. An equivocal result is defined by weak and/or focal cytoplasmic staining. ALK Gene Rearrangements by FISH may be useful for resolving an equivocal IHC result. Positive IHC results may predict response to ALK inhibitors.

Controls were run and performed as expected.

This assay is performed on formalin fixed paraffin embedded tissue, using the ALK D5F3 clone and a proprietary multimer based detection system.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.
