Lactate to Pyruvate Ratio, Whole Blood

ARUP test code 2007935

Lactic Acid	3.79 mmol/L	H	(Ref Interval: 0.31-2.00)
Pyruvic Acid	0.130 mmol/L	H	(Ref Interval: 0.030-0.107)

Lactate to Pyruvate Ratio	29
INTERPRETIVE INFORMATION: Lactate to Pyruvate Ratio, Whole Blood	
The blood lactate to pyruvate (L:P) ratio is used to distinguish between pyruvate dehydrogenase deficiency and other causes of congenital lactic acidosis. In conjunction with an elevated lactate, an L:P ratio greater than 30 suggests inherited disorders of the respiratory chain complex or tricarboxylic acid cycle disorders. In conjunction with an elevated lactate, an L:P ratio less than 25 suggests a defect in pyruvate metabolism. An artifactually high L:P ratio can be observed in acutely ill individuals. Abnormal concentrations of lactate, pyruvate, and the L:P ratio are not diagnostic for any single disorder and must be interpreted in the context of the individual's clinical presentation and other laboratory studies.	
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.
