

[REDACTED]

ARUP Test Code: 2008767

Collection Date: 01/30/2025

Received in lab: 01/30/2025

Completion Date: 01/30/2025

**OPRM1 Specimen Whole Blood**

**Patient Results**

Gene	Genotype	Flag	Phenotype	Flag
<i>OPRM1</i>	<b>GG</b>	<b>A</b>	See Note	

**OPRM1 Variant Interpretation**

Indication for testing: predict opioid sensitivity.

Interpretation: Two copies of the OPRM1 G allele (rs1799971) were detected in this sample. Decreased sensitivity to opioid receptor agonists and increased sensitivity to opioid receptor antagonists are predicted. This patient may require higher or more frequent doses of opioid receptor agonists (e.g., morphine) to achieve adequate pain control. He/she may also be more likely to respond to opioid antagonists (e.g., naltrexone) in the treatment of alcohol and/or opioid dependency. This association of OPRM1 and drug sensitivity is not definitive and may be different for individual opioids.

Recommendation: Annotations for clinical application of this OPRM1 allele are available through the Pharmacogenomics Knowledge Base at: <https://www.pharmgkb.org/gene/PA31945>

This result has been reviewed and approved by [REDACTED]

**Interpretive Comments**

BACKGROUND INFORMATION: Opioid Receptor, Mu OPRM1, 1 Variant

CHARACTERISTICS: The mu opioid receptor is involved in mediating the clinical response to opioids (agonists and antagonists).

OPRM1 c.118A>G has been associated with lower sensitivity to opioid receptor agonists prescribed for pain control (e.g., morphine) and higher sensitivity to opioid receptor antagonists used in the treatment of alcohol and drug dependency (e.g., naltrexone). Risk of side effects to opioids is also associated with this genetic variant.

INHERITANCE: Autosomal codominant.

CAUSE: SNP rs1799971; OPRM1 c.118A>G (p.Asn40Asp), also known as G allele, alters response to opioids.

CLINICAL SENSITIVITY: Drug dependent.

METHODOLOGY: Polymerase Chain Reaction (PCR) and Fluorescence Monitoring

ANALYTICAL SENSITIVITY and SPECIFICITY: Greater than 99 percent.

LIMITATIONS: Only the targeted OPRM1 mutation, c.118A>G, will be detected. Diagnostic errors can occur due to rare sequence variations. Risk of therapeutic failure or adverse reactions with opioids may be affected by genetic and nongenetic factors that are not detected by this test. This result does not replace the need for therapeutic or clinical monitoring.

Please note the information contained in this report does not contain medication recommendations and should not be interpreted as recommending any specific medications. Any dosage adjustments or other changes to medications should be evaluated in consultation with a medical provider.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

**Test Information**

The following tables list the available gene-drug pairs and genotype-based dosing published by the Clinical Pharmacogenetics Implementation Consortium (CPIC) and the FDA table of pharmacogenomic biomarkers in drug labeling.

**Published CPIC guidelines**

<b>GUIDELINES</b>	<b>DRUGS</b>	<b>GENES</b>
CYP2B6 and efavirenz	efavirenz	CYP2B6
CYP2C19 and Clopidogrel	clopidogrel	CYP2C19
CYP2C19 and Proton Pump Inhibitors	dexlansoprazole	CYP2C19
	esomeprazole	
	lansoprazole	
	omeprazole	
	pantoprazole	
	rabeprazole

\* Therapeutic areas do not necessarily reflect the CDER review division.

† Representative biomarkers are listed based on standard nomenclature as per the Human Genome Organization (HUGO) symbol and/or simplified descriptors using other common conventions. Listed biomarkers do not necessarily reflect the terminology used in labeling. The term “Nonspecific” is provided when labeling does not explicitly identify the specific biomarker(s) or when the biomarker is represented by a molecular phenotype or gene signature, and in some cases the biomarker was inferred based on the labeling language.
