CALR (Calreticulin) Exon 9 Mutation Analysis by PCR

ARUP test code 2010673

CALR Exon 9 Mutation Analysis - Result

Detected *

Fragment length-based testing demonstrates a 52 base pair deletion in the CALR gene, consistent with a CALR type 1 or type 1-like mutation.

This result has been reviewed and approved by ██████████, M.D.

Test information: CALR (Calreticulin), Exon 9 Mutation Analysis by PCR

This test is designed to detect CALR exon 9 insertion/deletion mutations. Insertion/deletion mutations in exon 9 of the CALR gene result in a frameshift and are found in the majority of cases of the myeloproliferative neoplasms, essential thrombocythemia (ET) and primary myelofibrosis (PMF) that lack JAK2 V617F mutations.

Methodology:
Genomic DNA is isolated from either whole blood or bone marrow. PCR followed by capillary electrophoresis is performed to detect CALR exon 9 insertion/deletion mutations.

Limitations:
Mutations in other locations within the CALR gene or mutations in other genes will not be detected.
The limit of detection for this test is 5 percent mutant alleles.

Results of this test must always be interpreted within the clinical context and other relevant data, and should not be used alone for a diagnosis of malignancy.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.
