CALR (Calreticulin) Exon 9 Mutation Analysis by PCR

ARUP test code 2010673

CALR Exon 9 Mutation Analysis - Result

Not Detected

This result has been reviewed and approved by [REDACTED]

A CALR exon 9 insertion/deletion mutation was not detected. This does not exclude the possibility of a CALR mutation that is not an exon 9 insertion/deletion. It also does not exclude the possibility of a CALR exon 9 insertion/deletion mutation below the assay limit of detection.

Background Information: CALR (Calreticulin), Exon 9 Mutation Analysis by PCR

This test is designed to detect CALR exon 9 insertion/deletion mutations. Insertion/deletion mutations in exon 9 of the CALR gene result in a frameshift and are found in the majority of cases of myeloproliferative neoplasms essential thrombocythemia (ET) and primary myelofibrosis (PMF) that lack JAK2 V617F mutations.

Methodology:

Genomic DNA is isolated from either whole blood or bone marrow. PCR followed by capillary electrophoresis is performed to detect CALR exon 9 insertion/deletion mutations.

Limitations:

Mutations in other locations within the CALR gene or mutations in other genes will not be detected.

The limit of detection for this test is 5 percent mutant alleles for canonical type 1 or 2-like variants and common noncanonical variants. The 1-bp deletion variant in Exon 9 cannot be detected or reported due to the limitation of the methods.

Results of this test must always be interpreted within the clinical context and other relevant data and should not be used alone for a diagnosis of malignancy.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.
