CBFB-MYH11 inv(16) Detection, Quantitative

ARUP test code 2011114

CBFB-MYH11 Result

Not Detected

CBFB-MYH11 fusion transcripts were not detected by RT-qPCR. This result does not entirely exclude the possibility of inv(16)/t(16;16) positive cells in the sample below the test limit of detection.

This result has been reviewed and approved by Kristin Karner, M.D.

INTERPRETIVE INFORMATION: CBFB-MYH11 inv(16) Quantitative

This test is designed to detect and quantify CBFB-MYH11 fusion transcripts (type A, D or E) which result from inv(16)/t(16;16);CBFB-MYH11, a recurrent genetic abnormality found in a subset of patients with acute myeloid leukemia.

Methodology:

Patient RNA is isolated, reverse transcribed into cDNA, and amplified using primers specific for the CBFB and MYH11 genes. A normalized ratio is calculated representing CBFB-MYH11 transcripts / ABL1 transcripts.

Limitations:

Translocations involving other genes or gene partners will not be detected. The limit of quantitation for this test is 0.0001 (NCN).

Results of this test must always be interpreted within the patient's clinical context and in conjunction with other relevant data. Results should not be used alone for a diagnosis of malignancy.

Test developed and characteristics determined by ARUP Laboratories. See Compliance Statement B: aruplab.com/CS
