Collection Date: 01/01/2017 12:34

MET Gene Amplification by FISH

ARUP test code 3001313

MET FISH Result

Not Amplified

This result has been reviewed and approved by Jong Taek Kim, M.D., M.S. Controls performed as expected.

INTERPRETIVE INFORMATION: MET Gene Amplification, FISH

Fluorescence in situ hybridization (FISH) analysis for MET gene amplification was performed on a section from a paraffin-embedded tissue block using differentially labeled fluorescent probes targeting the MET gene and the chromosome 7 centromere (CEP 7) (Abbott Molecular). Cells were evaluated from regions of tumor identified on histopathologic review of a matching hematoxylin- and eosin-stained section. Controls performed appropriately.

Based on the preclinical validation of this assay, MET gene amplification is defined as either a MET/CEP7 ratio of 2.0 or greater or an average MET gene copy number per cell of 6.0 or greater. Based on the assay performance during test validation, the test is expected to detect MET amplification status in 100 percent of patients. Assay range and limit of detection were generated using normal and known positive cases respectively.

MET gene amplification is observed in a variety of tumor types, including non-small cell lung carcinoma. High-level MET amplification (MET/CEP7 ratio greater than 5. See Ou et al. 2011) is considered an emerging biomarker for therapy with crizotinib in non-small cell lung carcinoma by the National Comprehensive Cancer Network (see NCCN Clinical Practice Guidelines in Oncology for Non-Small Cell Lung Carcinoma).

MET amplification may also be acquired as a therapy resistance alteration, eg, following anti-EGFR tyrosine kinase inhibition.
