

Client: ARUP Example Report Only
500 Chipeta Way
Salt Lake City, UT 84108
UNITED STATES

Physician: arup, arup

Patient: EXAMPLE, NEGATIVE

DOB: 5/24/2021
Gender: Female
Patient Identifiers: 30632
Visit Number (FIN): 30938
Collection Date: 5/25/2021 12:31

Emery-Dreifuss Muscular Dystrophy Panel, Sequencing

ARUP test code 3001839

Emery-Dreifuss Muscular Dystrophy Spec whole Blood

Emery-Dreifuss Muscular Dystrophy Interp

Negative

INDICATION FOR TESTING
Not provided

RESULT
No pathogenic variants were detected in any of the genes tested.

INTERPRETATION
No pathogenic variants were identified by massively parallel sequencing of the coding regions and exon-intron boundaries of the EMD, FHL1 or LMNA genes. This result decreases the likelihood of, but does not exclude, a diagnosis of Emery-Dreifuss muscular dystrophy. Please refer to the background information included in this report for the limitations of this test.

RECOMMENDATIONS
Medical screening and management of this individual should rely on clinical findings and family history. Genetic consultation is recommended.

COMMENTS
Likely benign and benign variants are not included in this report.

This result has been reviewed and approved by [REDACTED]

BACKGROUND INFORMATION: Emery-Dreifuss Muscular Dystrophy Panel, Sequencing

CHARACTERISTICS: Emery-Dreifuss muscular dystrophy (EDMD) is characterized by a clinical triad of early onset joint contractures (commonly involving elbows, ankles, and neck), slowly progressive limb muscle weakness and wasting, and cardiac disease. EDMD demonstrates intra- and interfamilial variability in age of onset, severity, and progression; although penetrance is high. Typical presentation includes joint contractures in first two decades of life, followed by muscle weakness and wasting, with cardiac involvement occurring in the second to third decades. Carrier females of X-linked EDMD are usually asymptomatic, but are at risk for developing cardiac disease, and less commonly, mild muscle disease.

EPIDEMIOLOGY: Prevalence 1-2:100,000.

H=High, L=Low, *=Abnormal, C=Critical

CAUSE: Pathogenic germline variants in EMD, FHL1, or LMNA.

INHERITANCE: X-linked for EMD or FHL1. Typically, autosomal dominant for LMNA; de novo variation is common. Autosomal recessive inheritance for LMNA is rare.

CLINICAL SENSITIVITY: 36 percent for EDMD.

GENES TESTED: EMD, FHL1, LMNA.

METHODOLOGY: Capture of all coding exons and exon-intron junctions of the targeted genes, followed by massively parallel sequencing. Sanger sequencing was performed as necessary to fill in regions of low coverage and confirm reported variants. Human genome build 19 (Hg 19) was used for data analysis.

ANALYTICAL SENSITIVITY/SPECIFICITY: The analytical sensitivity of this test is approximately 99 percent for single nucleotide variants (SNVs) and greater than 93 percent for insertions/duplications/deletions from 1-10 base pairs in size. Variants greater than 10 base pairs may be detected, but the analytical sensitivity may be reduced.

LIMITATIONS: A negative result does not exclude a diagnosis of EDMD. This test only detects variants within the coding regions and intron-exon boundaries of the targeted genes. Regulatory region variants and deep intronic variants will not be identified. Deletions/duplications/insertions of any size may not be detected by massively parallel sequencing. In males, lack of massively parallel sequencing coverage of one or more EMD or FHL1 exons may suggest the presence of large deletions; however, this should be confirmed by a validated method. Diagnostic errors can occur due to rare sequence variations. In some cases, variants may not be identified due to technical limitations in the presence of pseudogenes, repetitive, or homologous regions. This assay may not detect low-level mosaic or somatic variants associated with disease. Interpretation of this test result may be impacted if this patient has had an allogeneic stem cell transplantation. Noncoding transcripts were not analyzed.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.
