Physician: Doctor, Example

Patient: Patient, Example

DOB: 1/8/1962
Gender: Male
Patient Identifiers: 01234567890ABCD, 012345
Visit Number (FIN): 01234567890ABCD
Collection Date: 00/00/0000 00:00

KIT (D816V) Mutation by ddPCR, Quantitative

ARUP test code 3002956

KIT QNT, Source Bone Marrow

KIT D816V Variant Allele Frequency 0.00 %

KIT D816V Mutation by PCR Not Detected

There is no evidence of the KIT (D816V) point mutation by PCR analysis. This result does not entirely exclude the possibility that a KIT (D816V) mutation is present below the test limit of detection.

This result has been reviewed and approved by [REDACTED]

INTERPRETIVE INFORMATION: KIT (D816V) Mutation by ddPCR Quant

DNA from whole blood or bone marrow specimens is amplified in an allele-specific droplet digital (dd) PCR multiplex reaction targeting the KIT c.2447A>T single nucleotide variant encoding the D816V mutation and wild-type KIT. Results are reported as a percent mutated alleles. The results of this test must always be interpreted in the context of morphologic and other relevant data, and should not be used alone for a diagnosis of malignancy. The KIT D816V mutation can be detected down to 0.03 percent mutated alleles.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

H=High, L=Low, *=Abnormal, C=Critical
