# Autoimmune Movement Disorder Panel, Serum

Neuronal Antibody (Amphiphysin)	Negative	(Ref Interval: Negative)	
	<pre>INTERPRETIVE INFORMATION: Amphiphysin Antibody, IgG Amphiphysin antibody is present in about 5 percent of patients with stiff-person syndrome and is found variably in other causes of paraneoplastic neurological syndrome (PNS). Amphiphysin antibody is mainly associated with small-cell lung cancer and breast tumors. This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLTA certified laboratory and is intended for clinical purposes.</pre>		
Purkinje Cell/Neuronal Nuclear IgG Scrn			
	ANNA-1, ANNA-2, PCCA-1 or PCCA-Tr(DNER) antibodies not detected. No further testing will be performed.		
	INTERPRETIVE INFORMATION: Purkinje Cell/Neuronal Nuclear IgG Scrn		
	This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.		
NMDA Receptor Ab IgG CBA-IFA, Serum	<1:10	(Ref Interval: <1:10)	
	Antibodies to NMDA we follow.	ere not detected, no additional testing to	

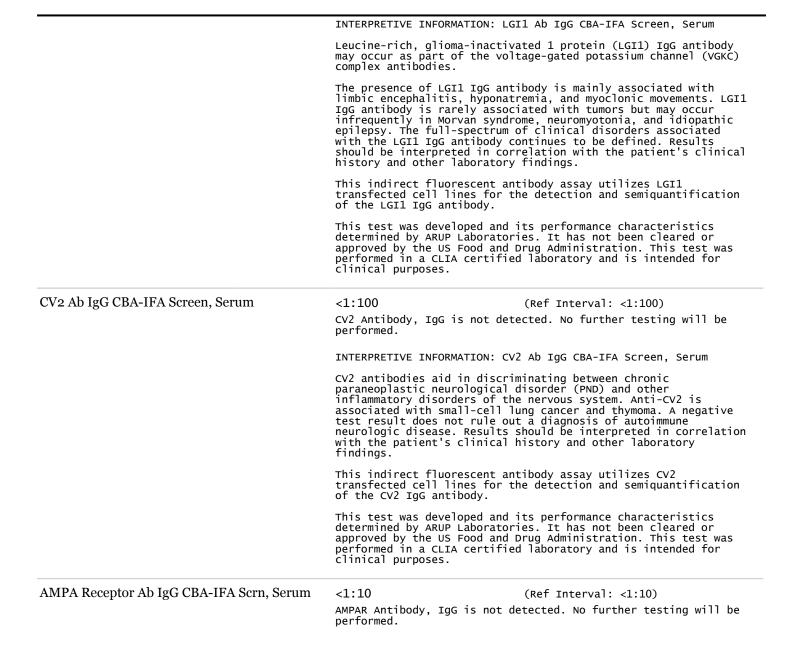

H=High, L=Low, \*=Abnormal, C=Critical

INTERPRETIVE INFORMATION: NMDA Receptor Ab IgG CBA-IFA, Serum

NMDA receptor antibody is found in a subset of patients with autoimmune limbic encephalitis and may occur with or without associated tumor. Decreasing antibody levels may be associated with therapeutic response. In addition, positive results have been reported in patients with non-autoimmune phenotypes. A negative test result does not rule out a diagnosis of autoimmune limbic encephalitis. Results should be interpreted in correlation with the patient's clinical history and other laboratory findings. Serum testing should be paired with CSF testing for improved diagnostic sensitivity. This indirect fluorescent antibody assay utilizes full-length GluN1 transfected cell lines for the detection and semiquantification of NMDA receptor IgG antibody. This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes. CASPR2 Ab IgG CBA-IFA Screen, Serum <1:10 (Ref Interval: <1:10) CASPR2 Antibody, IgG is not detected. No further testing will be performed. INTERPRETIVE INFORMATION: CASPR2 Ab IgG CBA-IFA Screen, Serum Contactin-associated protein-2 (CASPR2) IgG antibody may occur as part of the voltage-gated potassium channel (VGKC) complex antibodies. The presence of CASPR2 IgG antibody is associated with a wide spectrum of clinical manifestations, including acquired neuromyotonia, limbic encephalitis, painful neuropathy, and Morvan syndrome. Tumors such as thymoma, small cell lung cancer, and other rarer tumors may occur. The full-spectrum of clinical disorders and tumors associated with the CASPR2 IgG antibody continues to be defined. Results should be interpreted in correlation with the patient's clinical history and other laboratory findings. This indirect fluorescent antibody assay utilizes CASPR2 transfected cell lines for the detection and semiquantification of the CASPR2 IgG antibody. This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes. LGI1 Ab IgG CBA-IFA Screen, Serum <1:10 (Ref Interval: <1:10) LGI1 Antibody, IgG is not detected. No further testing will be performed.

	receptor (AMPAR) autoimmune limbic associated tumor. with therapeutic out a diagnosis o	roxy-5-methyl-4-isoxazoleproprionic acid antibody is found in a subset of patients with encephalitis and may occur with or without Decreasing antibody levels may be associated response. A negative test result does not rule f autoimmune encephalitis. Results should be rrelation with the patient's clinical history
	INTERPRETIVE INFO	RMATION: AMPA Receptor Ab IgG CBA-IFA Scrn, Serum

H=High, L=Low, \*=Abnormal, C=Critical

DPPX Antibody, IgG is not detected. No further testing will be performed.

INTERPRETIVE INFORMATION: DPPX Ab IgG CBA-IFA Screen, Serum

DPPX antibody is found in a subset of patients with autoimmune encephalitis, and is often associated with prodromal gastrointestinal symptoms and unintentional weight loss. It may occur with or without associated tumor. Decreasing antibody levels may be associated with therapeutic response. A negative test result does not rule out a diagnosis of autoimmune neurologic disease. Results should be interpreted in correlation with the patient's clinical history and other laboratory findings.

This indirect fluorescent antibody assay utilizes DPPX transfected cells for the detection and semiquantification of the DPPX IgG antibody.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

GABA-AR Ab IgG CBA-IFA Screen, Serum

#### (Ref Interval: <1:10)

GABA-AR Antibody, IgG is not detected. No further testing will be performed.

INTERPRETIVE INFORMATION: GABA-AR Ab IgG CBA-IFA Screen,

Serum Gamma-aminobutyric acid receptor, type A (GABA-AR) antibody is found in a subset of patients with autoimmune encephalitis or autoimmune epilepsy and may occur with or without associated tumor. A negative test result does not rule out a diagnosis of autoimmune limbic encephalitis or autoimmune epilepsy. Interpretation of any antineural antibody test requires clinical correlation.

This indirect fluorescent antibody assay utilizes GABA-AR transfected cell lines for detection and semi-quantification of GABA-AR IgG antibody.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

ITPR1 Ab IgG CBA-IFA Screen, Serum

<1:10 (Ref Interval: <1:10) ITPR1 Antibody, IgG is not detected. No further testing will be performed.

Genzen, MD, PhD, Laboratory Director Patient: Patient, Example ARUP Accession: 24-057-100508 Patient Identifiers: 01234567890ABCD, 012345 Visit Number (FIN): 01234567890ABCD Page 5 of 8 | Printed: 2/26/2024 11:55:53 AM 4848 INTERPRETIVE INFORMATION: ITPR1 Ab IgG CBA-IFA Screen, Serum

	Inositol 1, 4, 5-trisphosphate receptor type 1 (ITPR1) antibody is found in a subset of patients with autoimmune cerebellar ataxia, encephalitis, neuropathy, or myelopathy and may occur with or without associated tumor. A negative test result does not rule out a diagnosis of autoimmune cerebellar ataxia or related autoimmune neurologic disorders. Interpretation of any antineural antibody test requires clinical correlation.
	This indirect fluorescent antibody assay utilizes ITPR1 transfected cell lines for detection and semi-quantification of ITPR1 IgG antibody.
	This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.
IgLON5 Ab IgG CBA-IFA Screen, Serum	<1:10 (Ref Interval: <1:10)
	IgLON5 Antibody, IgG is not detected. No further testing will be performed.
	INTERPRETIVE INFORMATION: IqLON5 Ab IqG CBA-IFA Screen,
	Serum IgLON Family Member 5 (IgLON5) antibody is found in a subset of patients with autoimmune encephalitis or other autoimmune neurologic/neurodegenerative disorders and may occur with or without associated tumor. A negative test result does not rule out a diagnosis of an autoimmune neurologic disorder. Interpretation of any antineural antibody test requires clinical correlation.
	This indirect fluorescent antibody assay utilizes IgLON5 transfected cell lines for detection and semi-quantification of IgLON5 IgG antibody.
	This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.
mGluR1 Ab IgG CBA-IFA Screen, Serum	<1:10 (Ref Interval: <1:10)
-	mGluR1 Antibody, IgG is not detected. No further testing will be performed.
