**Antibody Identification**

Anti-E (RH3) was identified in this patient's serum. No additional red cell antibodies were apparent at this time.

Anti-E is a clinically significant antibody capable of causing hemolytic disease of the fetus and newborn (HDFN) and transfusion reactions.

Reactivity with all cells tested was also observed when testing this patient's serum with a solid phase method. The solid phase test method is an extremely sensitive procedure. This pattern of reactivity has not been consistently shown to be clinically significant.

If red cell transfusion is required for mother or infant, donor units selected shall be negative for the E (RH3) antigen and appear compatible by antiglobulin crossmatch.
