Physician: Doctor, Example

**Patient: Patient, Example**

**DOB:** 12/31/1752  
**Sex:** Male  
**Patient Identifiers:** 01234567890ABCD, 012345  
**Visit Number (FIN):** 01234567890ABCD  
**Collection Date:** 00/00/0000 00:00

**Bartonella quintana Antibody, IgG With Reflex to Endpoint Titer**

ARUP test code 3020065

B. quintana IgG Screen	<b>Positive</b>	*	(Ref Interval: Negative)
Bartonella henselae screen is positive. Titer result to follow.			
INTERPRETIVE INFORMATION: B. quintana Antibody, IgG with Reflex			
Negative: No significant level of B. quintana IgG			
Equivocal: Questionable presence of B. quintana IgG antibody detected. Repeat testing in 10-14 days may be helpful.			
Positive: Presence of IgG antibody to B. quintana IgG detected.			
A low positive result suggests past exposure or infection, while a high positive result may indicate recent or current infection, but is inconclusive for diagnosis. Seroconversion between acute and convalescent sera is considered strong evidence of recent infection. The best evidence for infection is significant change on two appropriately timed specimens where both tests are done in the same laboratory at the same time.			
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.			

**Bartonella quintana Antibody, IgG Endpoint Titer**

ARUP test code 3020063

B. quintana IgG Titer	<b>1:256</b>	*	(Ref Interval: <1:64)
INTERPRETIVE INFORMATION: B. quintana Antibody, IgG Endpoint Titer			
Less than 1:64 .....No significant level of B. quintana IgG.			
1:64 - 1:128 .....Questionable presence of B. quintana IgG antibody detected. Repeat testing in 10-14 days may be helpful.			
1:256 or greater ...Presence of IgG antibody to B. quintana detected.			
A low positive result suggests past exposure or infection, while a high positive result may indicate recent or current infection, but is inconclusive for diagnosis. Seroconversion between acute and convalescent sera is considered strong evidence of recent
