

## CYFRA 21-1 (Cytokeratin 19 Fragment) in Lung Cancer

CYFRA 21-1 (cytokeratin 19 fragment) has been demonstrated as clinically useful in the prognostication and monitoring of non-small cell lung cancer (NSCLC). Elevated pretreatment levels may be associated with unfavorable prognosis, and decreasing levels during therapy predict an objective response to treatment. However, the level of CYFRA 21-1 cannot be used as absolute evidence for the presence or absence of disease and results must be viewed in context with other clinical evidence.

### Disease Overview

#### Prevalence

Lung cancer is the second most common cancer in the U.S. and the most common cause of cancer-related deaths in both men and women.

#### Physiology

- Cytokeratins are intermediate filament structural proteins found in the cytoskeleton of epithelial tissue
- The two types of cytokeratins are:
  - Acidic type I
  - Basic or neutral type II
- Release of cytokeratins into the circulation occurs by numerous mechanisms such as:
  - Cellular apoptosis
  - Abnormal mitosis
  - Spillover from proliferating cells
- Cytokeratins are detected as partially degraded, single-protein fragments or complexes, but no intact molecules
- Elevations of cytokeratins are observed in lung cancer of all histologic types of NSCLC

#### Prognosis/Monitoring Issues

- CYFRA 21-1 has been demonstrated as clinically useful in prognostication and monitoring
- Elevated pretreatment CYFRA 21-1 in NSCLC is reported to be associated with unfavorable prognosis<sup>1,2,3</sup>
- Decreasing concentrations of CYFRA 21-1 in NSCLC predict objective response to treatment in advanced disease<sup>4,5</sup>

### Test Interpretation

#### Sensitivity

Clinical sensitivity: varies by disease stage<sup>6</sup>

Analytical sensitivity: limit of detection is 0.5 ng/mL

#### Results

Possible results include:

#### Tests to Consider

##### [CYFRA 21-1 \(Cytokeratin 19 Fragment\), Serum 0081344](#)

**Method:** Quantitative Enzyme-Linked Immunosorbent Assay

- Prognostication in NSCLC
- Monitoring treatment in NSCLC

##### **Related Tests**

For prognostication and monitoring in lung cancer

##### [Carcinoembryonic Antigen 0080080](#)

**Method:** Quantitative Electrochemiluminescent Immunoassay

##### [Neuron Specific Enolase 0098198](#)

**Method:** Quantitative Enzyme-Linked Immunosorbent Assay

##### [Squamous Cell Carcinoma, Serum 3003504](#)

**Method:** Immunofluorescence

- Elevated
- Normal (does not rule out NSCLC)

## Limitations

- Test is not suitable for lung cancer screening
- Results obtained with different tests or kits cannot be used interchangeably
- Test interference may occur with:
  - Hemolyzed specimens
  - Icteric specimens
  - Lipemic specimens
  - Interfering antibodies in specimen (human antimouse or heterophile antibodies)
- CYFRA 21-1 may also be elevated in:
  - Benign respiratory disease
  - Other cancers:
    - Urologic
    - Gastrointestinal
    - Gynecological
