Pulmonary Arterial Hypertension

Pulmonary arterial hypertension (PAH) is caused by widespread occlusion or destruction of the smallest pulmonary arteries, leading to increased blood flow resistance, right ventricular hypertrophy, and heart failure. Genetic testing is most appropriate when no obvious etiology for pulmonary hypertension is found or if a family history of PAH exists.

Disease Overview

Symptoms

- Shortness of breath
- Fatigue
- Syncope
- Chest pain
- Palpitations
- Edema

Epidemiology

Incidence: 1-2/million

Inheritance

- Autosomal dominant: ACVRL1, BMPR2, CAV1, ENG, KCNA5, KCNK3, and SMAD9
- Autosomal recessive: EIF2AK4

Test Description

See Genes Tested table for genes included in the panel.

Clinical Sensitivity

- 75-80% for familial cases
- ~25% for simplex cases

Limitations

- A negative result does not exclude a heritable form of pulmonary arterial hypertension.
- Diagnostic errors can occur due to rare sequence variations.

Tests to Consider

- **Pulmonary Arterial Hypertension (PAH) Panel, Sequencing and Deletion/Duplication 2009345**
  - **Method**: Massively Parallel Sequencing/Exonic Oligonucleotide-based CGH Microarray
  - Preferred test to confirm a diagnosis of PAH, especially in those with a family history of PAH

- **Pulmonary Arterial Hypertension (BMPR2) Sequencing and Deletion/Duplication 2003405**
  - **Method**: Polymerase Chain Reaction/Sequencing/Multiplex Ligation-dependent Probe Amplification
  - Acceptable test for individuals with clinical symptoms of PAH

- **Pulmonary Arterial Hypertension (BMPR2) Sequencing 2003410**
  - **Method**: Polymerase Chain Reaction/Sequencing
  - Alternate test for individuals with clinical symptoms of PAH

- **EIF2AK4-Associated Disorders (EIF2AK4) Sequencing 2010696**
  - **Method**: Polymerase Chain Reaction/Sequencing
  - Preferred test to confirm diagnosis or assess carrier status for an EIF2AK4-associated disorder such as pulmonary capillary hemangiomatosis (PCH) and pulmonary veno-occlusive disease (PVOD)

- **Familial Mutation, Targeted Sequencing 2001961**
  - **Method**: Polymerase Chain Reaction/Sequencing
  - Recommended test if there is a known familial sequence variant previously identified in a family member
• Interpretation of this test result may be impacted if the individual has had an allogeneic stem cell transplantation.

• The following will not be evaluated:
  o Variants outside the coding regions and intron-exon boundaries of the targeted genes
  o Regulatory region variants and deep intronic variants
  o Breakpoints of large deletions/duplications
  o Deletions/duplications in KCNA5
  o Noncoding transcripts

• The following may not be detected:
  o Deletions/duplications/insertions of any size by massively parallel sequencing
  o Deletions/duplications less than 1kb in the targeted genes by array
  o Some variants due to technical limitations in the presence of pseudogenes, repetitive, or homologous regions
  o Low-level somatic variants
  o Single exon deletions/duplications in the following exons:
    - EIF2AK4 (NM_001013703) 2, 5, 29, 34, 35

### Analytical Sensitivity

For massively parallel sequencing:

<table>
<thead>
<tr>
<th>Variant Class</th>
<th>Analytical Sensitivity (PPA) Estimatea (%)</th>
<th>Analytical Sensitivity (PPA) 95% Credibility Regiona (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNVs</td>
<td>99.2</td>
<td>96.9-99.4</td>
</tr>
<tr>
<td>Deletions 1-10 bp</td>
<td>93.8</td>
<td>84.3-98.2</td>
</tr>
<tr>
<td>Deletions 11-44 bp</td>
<td>100</td>
<td>87.8-100</td>
</tr>
<tr>
<td>Insertions 1-10 bp</td>
<td>94.8</td>
<td>86.8-98.5</td>
</tr>
<tr>
<td>Insertions 11-23 bp</td>
<td>100</td>
<td>62.1-100</td>
</tr>
</tbody>
</table>

*aGenes included on this test are a subset of a larger methods-based validation from which the PPA values are derived.

bp, base pairs; PPA, positive percent agreement; SNVs, single nucleotide variants

### Genes Tested
